

WHEN A COMPANY CARES FOR THEIR EMPLOYEES' HEALTH, SHARP LOVES TO PITCH IN.

Noida has been a hub to many businesses. In the city during winters, the air outside becomes toxic, the quality of the air indoor also deteriorates. Our client Visible Alpha (which creates a unified experience across analysis and reporting in about 2500sq. ft) had been trying to tackle this problem for some time when they met us.

CHALLENGE

This winter, the pollution level in Noida was at an all-time high. The pm2.5 levels were nearly touching 500. Visible Alpha has an area of around 2500 sq. ft where around 100 employees work. The old stand-alone purifiers were ineffective. The company wanted to offer a healthy and safe working environment. The challenge was to bring the indoor air quality, within acceptable international standards.

SOLUTION

Sharp provided 6 wall mounted air purifiers (FU551KE) for the employee working area.

RESULT

While the city struggled with breathable air, the units installed in the office performed exceptionally, bringing down to around 15. Not only did the quality of the air come under permissible international standards, but the overall stale smell also disappeared, making the environment healthy and safe.

As the Project head and administration Manager quoted –

“Pollution was a major concern and our old purifiers were quite ineffective. We tested out many air purifiers, but Sharps FU551KE model with the patented Sharp Plasmacluster Ion Technology, was the best solution for us. The pollution levels are under control”
